

SentinelWire™ Detection Playbooks v2.0

Overview

This document explains SentinelWire™ detection playbooks built on Wireshark profiles and IOC extraction workflows. It is designed for SOC analysts, DFIR teams, and threat hunters.

UNIVERSAL-DEFENSE (First-Click Triage)

- Purpose: Rapid anomaly detection within 30–60 seconds of traffic capture.
- Focus: DNS abuse, suspicious IPs, malformed packets, protocol misuse.
- Outcome: Decide whether deeper inspection is required.

MITM / ARP-SPOOF Playbook

- Indicators: Duplicate ARP replies, MAC-IP conflicts, broadcast poisoning.
- Profiles: MITM-MASTER, ARP-SPOOF.
- MITRE Mapping: T1557.002, T1040.

DNS Abuse & Tunneling

- Indicators: Long labels, high entropy domains, repetitive queries.
- Profiles: DNS-SUSPECT, LONG-DNS.
- MITRE Mapping: T1071.004.

Scanning & Reconnaissance

- Indicators: SYN-only packets, abnormal TCP flags.
- Profiles: SYN-WEIRD, TO-ME-NONROUTER.
- MITRE Mapping: T1046.

TLS & Encrypted C2

- Indicators: Suspicious SNI, JA3 mismatches, weak cipher negotiation.
- Profiles: TLS-ANOMALY.
- MITRE Mapping: T1573, T1071.001.

IOC Scoring Interpretation

Scores are calculated based on persistence, correlation, IOC type risk, and known-good reductions.
0–29 = Low, 30–69 = Medium, 70–100 = High confidence malicious indicators.
