

SentinelWire™ Threat Actor Mapping & MITRE ATT&CK;

Purpose

This document maps SentinelWire™ detections to MITRE ATT&CK; techniques and helps analysts reason from network artifacts to adversary behavior.

Behavior-Based Mapping Philosophy

- SentinelWire maps behavior, not attribution.
- Multiple techniques may map to a single IOC.
- Mapping supports hypothesis-driven threat hunting.

Common Network Techniques

- DNS Tunneling → T1071.004
- Man-in-the-Middle / ARP Spoofing → T1557.002
- Network Sniffing → T1040
- Network Service Discovery / Scanning → T1046
- Encrypted Command & Control → T1573

From IOC to Threat Actor

Repeated high-confidence techniques across sessions may indicate APT-style tradecraft, while single noisy indicators often map to commodity malware.

Operational Use in SOC

Use MITRE mapping to prioritize alerts, align detections with playbooks, and communicate findings to stakeholders in a standardized language.
