

How to Interpret SentinelWire™ Results

(Analyst Decision Guide)

Understanding IOC Scores

SentinelWire™ scores are **prioritization tools**, not verdicts.

Score Range		Meaning	Analyst Action
0–29		Likely benign / noise	No immediate action
30–69		Suspicious	Contextual validation
70–100		High confidence	Deep analysis & escalation

Interpreting Beaconing Signals

High beacon scores indicate:

- Automated behavior
- Potential malware callbacks
- Update checks masquerading as benign traffic

Next actions

- Pivot to **BEACON-TIME**
- Inspect timing consistency
- Correlate with TLS / DNS metadata

Interpreting Lateral Movement Signals

Lateral indicators suggest:

- Internal discovery
- Credential misuse
- Unauthorized peer access

Next actions

- Pivot to **SMB-LATERAL** or **LLMNR-SUSPECT**
- Identify source host role
- Check for multiple internal targets

Combining Signals (Most Important)

The strongest findings emerge when **multiple signals align**:

- Beaconsing + lateral movement
- Internal discovery + MITM indicators
- High score + MITRE technique clustering

This indicates **post-compromise behavior**, not isolated anomalies.

Final Notes

SentinelWire™ is intentionally:

- Transparent
- Analyst-driven
- Explainable

It does **not** replace SIEMs or IDS systems.

It complements them by turning **PCAP data into structured behavioral insight**.
